Barak

Barak is a compact limestone, hewn in the Galilee region, light gray in color and rich in fossil fragments. The raw material undergoes a rigorous screening process to obtain a uniform color and to exclude foreign substances.

A particularly hard stone with low absorbency, Barak is suitable, among other things, the paving industry for granulate coating of surfaces and walls, floor coverings, finishing materials for the construction industry, and more.

Size (in mm)	16-25	9-16	2.5-9	1.4-2.5
