Yellow

Yellow is a macro crystalline compact limestone rock, known also as a "Khilu" type stone, which is quarried in the Galilee region. Yellowish cream in color, tending toward ivory, this stone is cut at sites where blocks of marble were quarried in the past. The raw material undergoes a strict selection process in order to obtain a uniform color without detritus. It is a particularly hard stone with low absorptivity, which is suitable, among other things, epoxy surfaces for, granulite coating of surfaces and walls, floor coverings and colored asphalt.

Size (in mm)	16-25	9-16	2.5-9	1.4-2.5
